Q.1 Explain data flow.

- Encapsulated the data movement component the etc.
- one or more source components design the data stores from which data will be extracted.
- one or more destination components, design the data stores into which the data will be loaded.
- one or more transformation components designing the transformation through which the data will be pushed.

Q.2 Explain connection manager.

> data access is provide to control flow task and data flow components through special SSIS objects called connection manager.

Provides connection to data store either as data source or data destination.

→ Because the same data store can play the role of the data source as well as the data destination.

→ Connection Manager allows the connector to be defined once and use many times in the same package (or project).
